

3 Beams

Beams

3.1 Beams

These are used for supporting of horizontal pipes in double-rod hanger assemblies, e.g. RH2, RH4-6, SH4-7, variable support assemblies VS2 and rigid struts RS2. For basic division of beam types according to application see Table 3.1. Beams are differentiated according to the type of attachment to pipe and rods. Usual beam type selected enable attachment to pipe using a welding

or clamp support, which serves to determine position of pipe provided with heat insulation and restriction of heat transmission. The local contact temperature of beam under support will not exceed 150–200 °C. Direct placement of support onto beam can be selected for pipe without insulation or in justified cases only. Protection against burning must be ensured, as these beams conduct heat directly from pipe surface.

Table 3.1 – Summary of Beam Types

Type	Description	Attachment to pipe	Attachment to rod
311	For tube suspension (steel and plastic) DN10-DN50	Circular clamps	Directly via nut
321	For suspension of pipes up to DN50 and temperature up to 150°C	Support	Eye for clevis with pin
334	For assemblies of hanger types RH and SH	Support	Eye for clevis with pin
341	For attachment of spring blocks type 1 × 4	Support	Bolted to spring cage
351	Beam for linkage of rods	-	Directly via nut
371	Beam for assemblies RH2, RH5, SH4-6	Directly on beam	Eye for clevis with pin
372	Beam for support assemblies VS2	Directly on beam	Surface for support head
381	Beam for assemblies RH2, RH5, SH4-6	Directly on beam	Eye for clevis with pin
382	Beam for double-spring supports VS/CS5 or for rigid strut assemblies RS2	Directly on beam	Clevis type 440

3.2 Application

Type selection depends is based on assessment of the function required with respect to recommendations below:

- regular hanger assemblies should be used with beam type 334 with support,
- spring hangers with short construction length should be used with beam type 341,
- beams type 371 and 381 are selected in case of collision risk in the space under suspension node,
- beams may be used with shortened supports types, e.g. type 615A and 615.

All supports must be welded on beam to secure their position. Thermal or other displacements of pipe must result in deflection

of hanger rods, not in displacement of pipe on the beam. The support base is fixed onto beam by means of field weld.

3.3 Beam Design Temperature

Design temperature ratings of beams differ depending on their types and piping temperature, as defined in Table 3.3. Determining the design temperature is necessary for determination of load correction factor, as defined in Table 3.2. Beams made of material grade S235JR are used for minimum ambient temperature of -20°C, steel grade S355J0 is installed in applications for up to -40°C. For details of lowest temperature threshold for other materials refer to Table A.7 – A.10.

Table 3.2 – Design Temperature of Beams t_d

Beam type	Tube attachment	Pipe temperature TS (°C)						
		< 80	< 150	< 350	< 450	< 500	< 550	< 600
311, 321	Directly on beam	80 °C	150 °C	-	-	-	-	-
311, 321	Via support	80 °C	80 °C	150 °C	-	-	-	-
334, 341	Via support	80 °C	80 °C	150 °C	200 °C	225 °C	250 °C	(300 °C)
351	-				80 °C			
371, 372	Directly on beam	$t_d = TS, t_d = 250$					-	
381, 382	Directly on beam	80 °C				$t_d = TS$		

3 Beams

Beams

3.4 Beam Load Capacity

Permissible loads F_p stated in dimension tables for particular types has been determined for material group 1 and the temperature corresponding with the design temperature t_d stated in Table 3.2. Load capacities for values given in brackets need to be checked with the manufacturer.

Beams type 381 and 382 make an exception, as the values in table refer to their permissible loads for temperature of 80 °C and material group 1. For higher temperatures and other materials, the value of F_p in table shall be multiplied by the material-temperature coefficient $k_{T,M}$. The values of correction factors $k_{T,M}$ stated in Table 3.3 have been defined for sustained loads in category G and the service life of 200,000 hours. Values in brackets relate to occasional loads of category Q.

Table 3.3 – Permissible Load Correction Factor at Temperature – $k_{T,M}$ (-) for Beams 371, 372, 373, 374

Temperature t_d (°C)	80	100	150	200	250	300	350	400	450	500	520	540	560

Beam sections are designed pursuant to conditions applicable for permissible strain and buckling (skew) of beams.

Hanger beams must be further designed in the same load capacity class as hanger rods.

To ensure stability of beams against skew the maximum pitch E specified in particular catalogue data sheets shall not be exceeded. Other cases need to be consulted with the manufacturer.

For a summary of attachment dimensions and load capacity classes see the Table 3.3.

Table 3.4 – Summary of Rod Attachments

Rod diameter d (mm)	Pin diameter dc (mm)	Hole diameter d1 (mm)	Band width T (mm)	Load capacity class	Permissible connection load (kN)

72	80	85	40	11	333
80	90	95	50	12	471

3.5 Surface Treatment

Beams are delivered with primer coating as standard. Beams for smaller piping are galvanized or hot-dipped.

3.7 Welding

Supports laid on beam must be secured against movement by means of welded seam. Tack welding from the support base bottom side is usually sufficient, 4 tacks of 3-5 mm in length each. Longer welds would cause damage to the surface treatment under support, i.e. at places preventing application of corrective coating.

3.6 Insulation

Beams type 311-351 may not pass through insulation. The height of selected pipe support must ensure clearance of at least 30 mm between the insulation surface and beam flange.

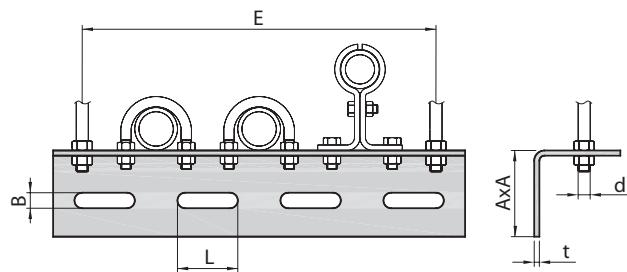

3 Beams

Beam Type 311 a 321

Beam Type 311

Application

Beam for suspension of bare tubing sized DN10 to DN33 using circular clamps type 701 or insulated and insulated tubing using supports type 602. Attachment to rods – direct to thread rods size M10.

Material

Carbon steel, galvanized by A3K method.

Marking

10	52	9	35	3	200–1 000 by increments of 60	0.21	0.3

Beam Type 321

Application

Application of beam for double rod hangers for suspension of piping up to DN80, supported by means of support. Attachment to rods – thread rods size M12. The beam is not designed for piping with horizontal displacement exceeding 30 mm. Optional placement of multiple supports.

Material

Steel S235JR or S355J0.

Surface treatment

Galvanized using A3K method or with primer coating.

Marking

3 Beams

Beam Type 334

Beam Type 334

Application

Beam for double-rod hangers for suspension of piping of any diameter. Attachment to rods – clevis with pin type 842. Piping is attached to the beam using supports type 5 or 6. Use of shortened supports is also possible.

Material

Steel S235JR or S353J0.

Surface treatment

Primer or top coating.

3 Beams

Beam Type 341

Beam Type 341

Application

Attachment to spring block type 1 x 4 using a sectional joint and pins. The beam is provided with a welded backstop leaning against the eye attached to the spring. Piping is attached to the beam via supports type series 5 or 6. Each supports must lie in the centre of beam span. Beam size U is selected depending on required load under operating conditions and the test condition, depending on pitch E. Values of permissible loads and applicable dimensional combinations are defined in the relevant table.

Material

Steel S235JR or S355J0.

Surface treatment

Primer or top coating.

Load capacity classes and the relevant diameters of pins and rods are specified on page A.11 of the catalogue. The load for piping pressure test equals to 1.5 times the permissible operating load F_p . Beams for any loads exceeding the maximum permissible thresh-

old are supplied on request. Assemblies for spring blocks up to size 6 inclusive are delivered fully assembled with beams. Beams for spring blocks exceeding size 7 need to be assembled on the installation only.

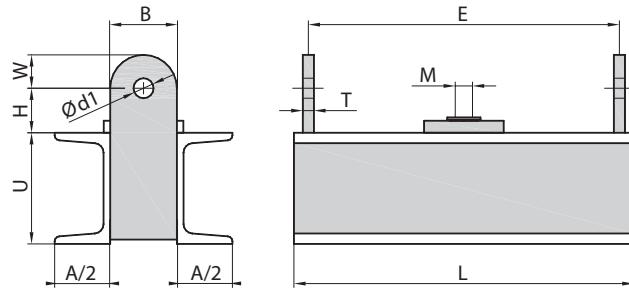

3 Beams

Beam Type 351

Beam Type 351

Application

The beam is used for joining two rods into one in hanger assemblies RH 4-6 and SH/CH 11-19. Attachment of rod pair to clevises with pins on the hanger edge, attachment of centre rod to the spherical pad, which forms a part of beam, via a pair of nuts. The load capacity class of rod pair is usually one level below values for a single centrally located rod only. Turn the beam eyes up or down is allowed.

Material

Steel S235JR or S355J0.

Surface treatment

Primer or top coating.

Marking

Type	Size	Pitch	TU1	TU2
351	U	E	TU1	TU2

TU1 = load capacity class for single rod

TU2 = load capacity class for a pair of rods

72	85	40	220	130	130

Remarks

The table of connections uses M to designate nominal rod diameter, d1 refers to the diameter of hole for connection of pins for a pair of rods. Permissible load has been defined for temperature of 80 °C and it relates to load of a single rod by means of central con-

centrated force. Permissible load of $1.5 \times F_p$ can be considered for pressure test condition. The total length of beam is $L = E + 2 \times T$. Beam weight has been specified for approximately 100 mm of length.

Permissible load on beam depending on pitch E for various beam sizes

3 Beams

Beam Type 371

Beam Type 371

Application

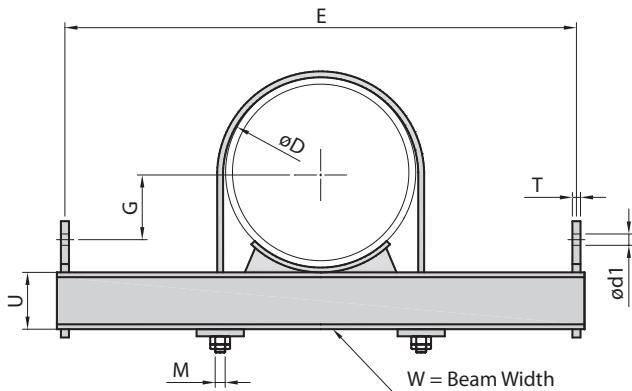

Beam formed by a pair of rolled U-sections for double-rod hangers for horizontal pipes, hanger assemblies RH2, RH5 and SH 4-6. Attachments to rods – clevis with pin type 842. Only for temperatures up to 250 °C (limited by heat transmission). Two different size versions of beam sections for lower and higher load capacity.

Material designs

S235JR/J2 – group No. 1

1.4301 – group No. 6*

* Remark: Material group No. 6 – the beam is made of carbon steel, the clamp and cradle are of stainless steel.

Marking

Permissible load

Values F_p and dimensions of connections have been determined for t_d = 250 °C. No correction is applied to permissible load for lower temperatures.

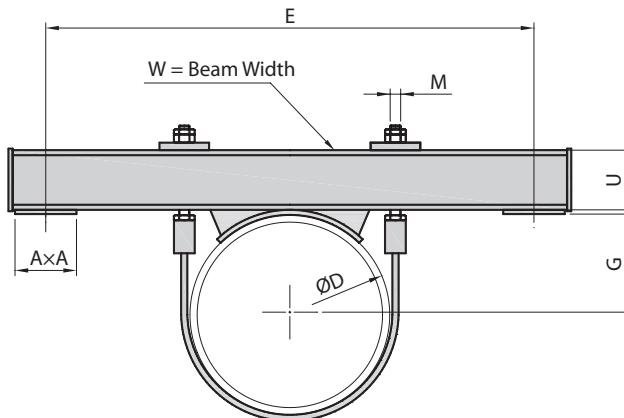

3 Beams

Beam Type 372

Beam Type 372

Application

Beam formed by a pair of rolled U-sections for double-spring supports for horizontal piping in assemblies VS2. The head of spring support is located under a plate sized of $A \times A$ dimension. For temperatures up to 250 °C only (limited by heat transmission). Horizontal displacements exceeding 10 mm require application of a pair of antifrictional sliding surfaces. Attention is required with respect to displacement reserves of the support head – thrust plate dimensional pair. The beam can be also used for rigid struts type 1.6, where the clevis is welded to thrust plate.

Material designs

S235JR/J2 – group No. 1
1.4301 – group No. 6*

* Remark: Material group No. 6 – the beam is made of carbon steel, the clamp and cradle are of stainless steel.

Permissible load

Values F_p have been determined for $t_d = 80^\circ\text{C}$. Higher design temperatures t_d will be subject to temperature correction factor $k_{T,M}$ from Table 3.2.

The beam can be also used inverted, as the clamp has been rated for load values included in the relevant tables. However, such non-standard design must be specified in detail.

The beam is recommended for applications up to 450–500°C due to heat transmission into ambient environment. Parts protruding outside insulation may reach contact temperature exceeding 60 °C!

3 Beams

Beam Type 382

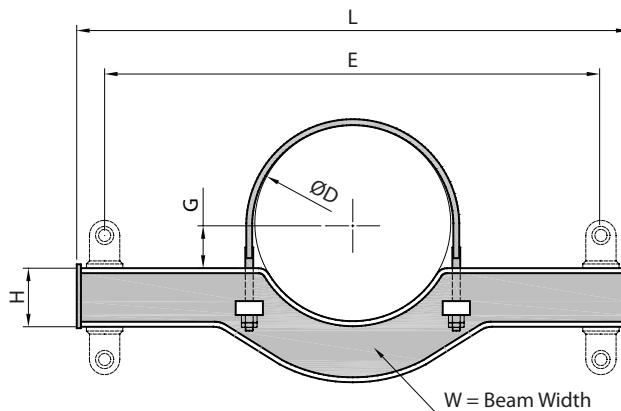

Beam Type 382

Application

Beam comprising a welded H-section for double-spring supports for horizontal pipes in assemblies VS/CS5 or rigid struts for assemblies RS2. The beam can be used with piping located below or above beam. Temperature range up to 500 °C. Parts protruding outside insulation may reach contact temperature exceeding 60 °C! Two different sizes of beam sections. The bottom edge of beam is just under the pipe, the assembly is suitable for space with low clearance heights.

Permissible load

Values F_p have been determined for $t_d = 80^\circ\text{C}$. Higher design temperatures t_d will be subject to temperature correction factor $k_{T,M}$ from Table 3.2.

The beam is recommended for applications up to 450–500°C due to heat transmission into ambient environment. Parts protruding outside insulation may reach contact temperature exceeding 60 °C!

Installation

Piping should be located as close to the beam centre as possible to prevent uneven load of rods. Each beam must be in horizontal position within tolerance of 1 %. Beams type 334 can be used for piping axially inclined up to 45°. We recommend to keep the support position within the range of $+/- 0.2 \times E$ from the beam centre, where E refers to pitch of hanger rods. Pipe support is field welded to the beam in accordance with assembly drawing. Galvanized beams for outdoor applications must be delivered with supports featuring beam stops (type G) to avoid site welding.

Hanger rods attached to the beam may not pass through insulation of piping above the beam!

Modification of beam by means of additional welded spherical pad type 932 is provided for hanger assemblies RH 4-6 and SH 11-19. Each pad must be right in the centre of beam span. The pad is attached to beam by means of field weld.
